TSX VENTURE TICKER: ADK

DIAGNOS acquires three new mining properties in the Abitibi region for nickel and gold

Brossard, Quebec, Canada – March 23, 2007 - DIAGNOS inc. ("DIAGNOS" or the "Company") (TSX VENTURE: ADK), a leader in knowledge extraction and artificial intelligence, announced today it has acquired three new properties based on the interpretation of a database from the Quebec government in the Abitibi region.

These new mining titles are located in the Val D'Or, Matagami and Amos areas (in 32C and 32E NTS sheets); zones with high production of ore. The different properties are the:

- Courville property located in the Barraute mining district which is host to several polymetallic VMS deposits as well as several high technology metal deposits (Molybdenum and Lithium) and showings such as the Maruska gold showing that returned 8.2 g/t over 0.9 meter in drill core, and grab samples that returned 107.2 g/t Au, 241.8 g/t Au and 97.3 g/t Ag;
- Lac Ledieu property located in the Brouillan mining district, a relatively unexplored region, host to two known gold and base metal deposits such as the Selbaie deposit – 3,061,125 tons at 39.43 g/t Ag, 1.23 g/t Au, 4.49% Cu, and 0.80% Zn and the B-26 VMS deposit – 600,000 tons at 2.88 g/t Au and 2.80% Cu and host to over 30 showings of orogenic gold and volcanogenic massive sulfide;
- NiCo property located in the Maizerets Township on a peridotite sill that returned over 1,000ppm on approximately 110 meters and is extremely promising for the discovery of Nickel-Copper-Chrome mineralization among others.

These acquired properties were selected based on DIAGNOS' CARDS (Computer Aided Resource Detection Software) application that highlights area with high mineral potential and having the same signature as the past and currently producing base and precious metal mines in the region.

Moreover, DIAGNOS is currently in negotiation with several companies of mining exploration for partnerships on these properties.

About DIAGNOS

DIAGNOS inc. develops and markets data mining software. The Company designed and developed MCubiX, a data mining software suite capable of extracting knowledge from historical data - in the form of images, text or traditional databases - and making predictions that improve business processes and decision making ability. CARDS (*Computer Aided Resource Detection Software*) can be applied to several sectors of prospecting, such as diamond, gold, zinc, copper and the oil and gas, and each one of these resources require a distinct methodology endorsed by the application. For further information, please visit our Website at www.diagnos.ca.

The Company's objective is to develop a royalty stream by significantly enhancing and participating in the exploration success rate of mining and oil and gas companies.
